Practical aspects of Deep Learning

Latest Submission Grade 100%

1. If you have 10,000,000 examples, how would you split the train/dev/test set? **1 / 1 point**

- ○ 33% train . 33% dev . 33% test
- ◉ 98% train . 1% dev . 1% test
- ○ 60% train . 20% dev . 20% test

Correct

2. The dev and test set should: **1 / 1 point**

- ○ Come from different distributions
- ◉ Come from the same distribution
- ○ Be identical to each other (same (x,y) pairs)
- ○ Have the same number of examples

Correct

3. If your Neural Network model seems to have high bias, what of the following would be promising things to try? (Check all that apply.) **1 / 1 point**

- ☑ Make the Neural Network deeper

Correct

- ☐ Get more test data
- ☑ Increase the number of units in each hidden layer

Correct

- ☐ Get more training data
- ☐ Add regularization

4. You are working on an automated check-out kiosk for a supermarket, and are building a classifier for apples, bananas and oranges. Suppose your classifier obtains a training set error of 0.5%, and a dev set error of 7%. Which of the following are promising things to try to improve your classifier? (Check all that apply.) **1 / 1 point**

- ☑ Increase the regularization parameter lambda

Correct

- ☐ Decrease the regularization parameter lambda
- ☑ Get more training data

Correct

- ☐ Use a bigger neural network

5. What is weight decay? **1 / 1 point**

- ○ A technique to avoid vanishing gradient by imposing a ceiling on the values of the weights.
- ○ Gradual corruption of the weights in the neural network if it is trained on noisy data.
- ○ The process of gradually decreasing the learning rate during training.
- ◉ A regularization technique (such as L2 regularization) that results in gradient descent shrinking the weights on every iteration.

Correct

6. What happens when you increase the regularization hyperparameter lambda? **1 / 1 point**

- ○ Doubling lambda should roughly result in doubling the weights
- ○ Weights are pushed toward becoming bigger (further from 0)

- ○ Gradient descent taking bigger steps with each iteration (proportional to lambda)
- ◉ Weights are pushed toward becoming smaller (closer to 0)

✓ Correct

7. With the inverted dropout technique, at test time: **1 / 1 point**

- ◉ You do not apply dropout (do not randomly eliminate units) and do not keep the 1/keep_prob factor in the calculations used in training
- ○ You apply dropout (randomly eliminating units) and do not keep the 1/keep_prob factor in the calculations used in training
- ○ You do not apply dropout (do not randomly eliminate units), but keep the 1/keep_prob factor in the calculations used in training.
- ○ You apply dropout (randomly eliminating units) but keep the 1/keep_prob factor in the calculations used in training.

✓ Correct

8. Increasing the parameter keep_prob from (say) 0.5 to 0.6 will likely cause the following: (Check the two that apply) **1 / 1 point**

- ☐ Increasing the regularization effect
- ☑ Reducing the regularization effect

✓ Correct

- ☐ Causing the neural network to end up with a higher training set error
- ☑ Causing the neural network to end up with a lower training set error

✓ Correct

9. Which of these techniques are useful for reducing variance (reducing overfitting)? (Check all that apply.) **1 / 1 point**

- ☑ L2 regularization

✓ Correct

- ☐ Vanishing gradient
- ☑ Data augmentation

✓ Correct

- ☐ Xavier initialization
- ☑ Dropout

✓ Correct

- ☐ Exploding gradient
- ☐ Gradient Checking

10. Why do we normalize the inputs x? **1 / 1 point**

- ○ Normalization is another word for regularization--It helps to reduce variance
- ○ It makes the parameter initialization faster
- ○ It makes it easier to visualize the data
- ◉ It makes the cost function faster to optimize

✓ Correct
